A Two-stage (conventional)
Estimates
rater × image × condition
Lin's statistics per rater
ρc, r, Cb, v, u
Compare means between conditions
(one number per rater)
B One-stage (proposed)
Estimates
rater × image × condition
Mixed model of all estimates
bias and calibration by condition
rater × method, image effects
severity-dependent dispersion
Curves along the severity range
bias, SD among raters,
expected absolute error,
differences with simultaneous bands
